

# Fundamentals of Multimedia

3<sup>rd</sup> Edition

Chapter 2 :A Taste of Multimedia

- 
- This chapter introduces:
    - A set of tasks and concerns that are considered in studying multimedia:
      - What a MM content is made of?
      - How a MM application works?
      - How MM special effects are produced?
    - Issues in multimedia production and presentation are discussed
      - Color principles
      - Compression meaning
      - Multimedia sharing
      - Useful tools

## 2.1 Multimedia Tasks and Concerns

- Multimedia content is ubiquitous in software all around us, including in our phones.
- We are interested in making interactive applications (or “presentations”), using:
  - video editors such as **Adobe** Premiere or **Cyberlink** PowerDirector
  - still-image editors such as **Adobe** Photoshop in the first instance,
- but then
  - combining the resulting resources into *interactive* programs by making use of “authoring” tools such as **Flash** and Director that can include sophisticated programming.

## 2.1 Multimedia Tasks and Concerns

- Problems and considerations involving computer science
- Computer Vision and Artificial Intelligence to *understand* image content
  - Smart cameras → find faces in the images
  - Scene recognition: “Where has this image been taken?”
  - Object classification: “Does the image contain a particular object?”
  - Object detection: “Where is an object of interest?”
  - Image segmentation: “Which object does each pixel belong to?”
- Multimedia systems in general have to deal with these problems borrowing algorithms and tools from computer science but these are not covered in this course.

## 2.2 Multimedia Presentation

- What effects to consider for multimedia presentation
  - **Color Contrast**
  - **Sprite Animation**
  - **Video Transitions**
- Guidelines for content design
  - *good* use of color and fonts
  - careful combination of color schemes and graphics
  - human visual dynamics considerations

## 2.2 Multimedia Presentation

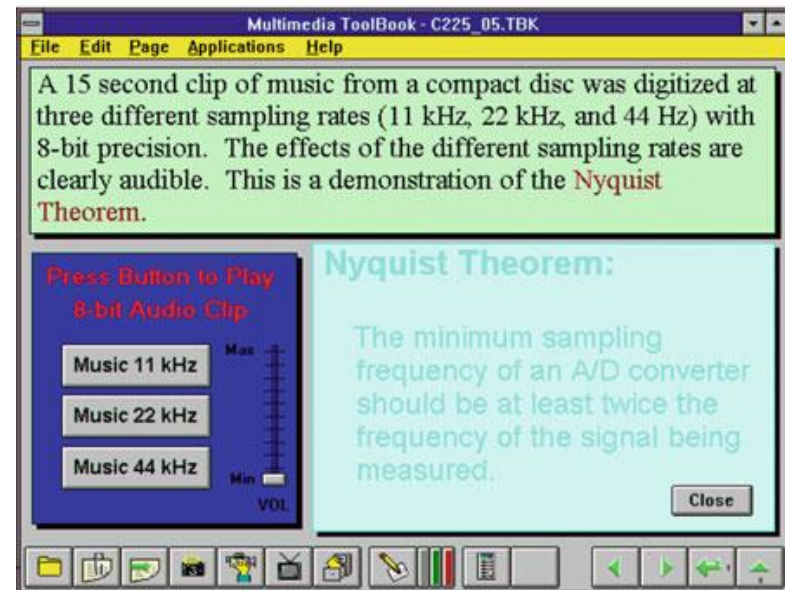

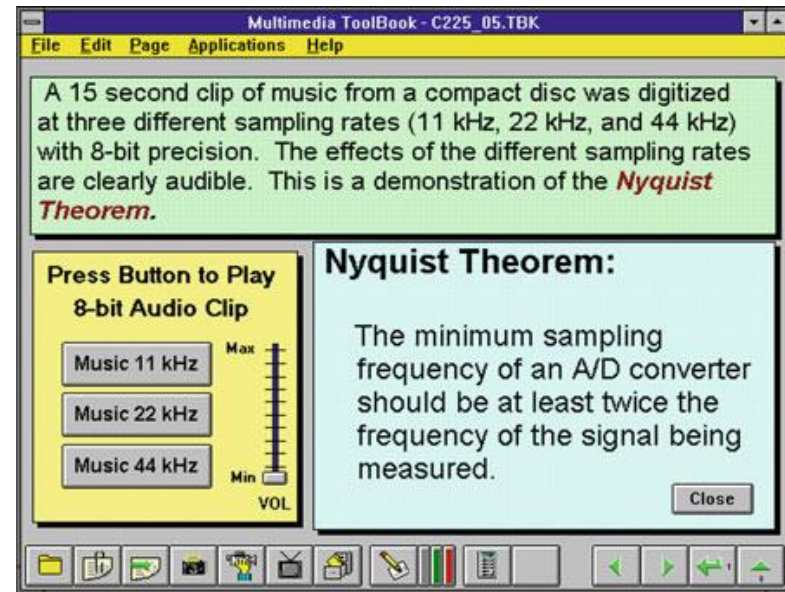

- **Graphics Styles**

- Careful thought has gone into combinations of color schemes and how lettering is perceived in a presentation.
- When constructing presentation then the Human visual dynamics should be considered.
- **Human visual dynamics** :As soon as the eye moves (saccades ترمش) it re-adjusts its exposure both chemically and geometrically by adjusting the iris بؤبؤ which regulates the size of the pupil القزحية.
- تمرين اختياري: define in more detail what is Human Visual Dynamics.

## 2.2 Multimedia Presentation

- **Color Principles and Guidelines**
- See these two figures. Which one is more legible?
- Some *color schemes and art styles are best combined with a certain theme or style.*
- A general hint is to *not use too many colors*, as this can be distracting.
- It helps to be consistent with the use of color
- Then color can be used to signal changes in theme.

## 2.2 Multimedia Presentation

- **Fonts**
- For effective visual communication,:
  - large fonts (18 to 36 points) are best,
  - with no more than six to eight lines per screen.
- (*See Figure in previous slide.*)
- Upper part is **good**, while bottom one is **poor**.
  - (*Why do you think?*)

## 2.2 Multimedia Presentation

- **A Color Contrast**
- The simplest approach to making readable colors on a screen is to use the principal complementary color as the background for text.
- For color values in the range 0–1 (or, effectively, 0–255), if the **text** color is some triple (Red, Green, Blue), or (R, G, B) for short, a legible color for the **background** is likely given by that color subtracted from the maximum:

$$(R, G, B) \Rightarrow (1 - R, 1 - G, 1 - B) \text{ or}$$

$$(R, G, B) \Rightarrow (255 - R, 255 - G, 255 - B)$$

- A way to make reasonable color on a screen is the color “opposite”: if the text is bright, the background is dark, and vice versa.

## 2.2 Multimedia Presentation

- **Sprite (شبح) Animation**

- Sprites are often used in animation.
- This simple example of animation (page 29-30)... توضیحات مربوطه را مطالعه کنید...

## 2.2 Multimedia Presentation

- **Video Transitions**

- Video transitions are syntactic نحوي means to signal “scene changes” and often carry semantic دلالات لفظية meaning.
- Many different types of transitions exist; the main types are:
  - *cuts,*
  - *wipes,*
  - *dissolves,*
  - *fade-ins,*
  - *fade-outs.*

## 2.2 Multimedia Presentation

### Types of Transitions:

- **A cut:** carries out an abrupt change of image contents in two consecutive video frames from their respective clips. It is the:
  - simplest and
  - most frequently used video transition.
- **A wipe:** is a replacement of the pixels in a region of the viewport with those from another video.
- **A dissolve:** replaces every pixel with a mixture over time of the two videos, gradually changing the first to the second.

## 2.2 Multimedia Presentation

### Video Transitions: Dissolve

- Type I (cross dissolve): every pixel is affected gradually.

$$D = (1 - \alpha(t)) \cdot A + \alpha(t) \cdot B$$

$$\alpha(t) = kt, \quad \text{with } kt_{\max} \equiv 1$$

- Fade-in and fade-out are special types of a Type I dissolve
- Type II (dither dissolve) video A will abruptly (instead of gradually, as in Type I) change to video B part by part. The positions of the pixels subjected to the change can be random or sometimes follow a particular pattern.
  - Wipes are special forms of a Type II dissolve

## 2.2 Multimedia Presentation

### Video Transitions: Dissolve- Slide in/out

```
for  $t$  in  $0..t_{max}$ 
  for  $x$  in  $0..x_{max}$ 
    if  $(\frac{x}{x_{max}} < \frac{t}{t_{max}})$ 
       $R = R_L (x + x_{max} * [1 - \frac{t}{t_{max}}], t)$ 
    else
       $R = R_R (x - x_{max} * \frac{t}{t_{max}}, t)$ 
```

## 2.3 Data Compression

- One of the most evident and important challenges of using multimedia is the necessity to compress data.
- we need excellent and fast data compression in order to avoid such high data rates that cause problems for storage and networks. (See Table 2.1 for Uncompressed Video sizes)

**Table 2.1** Uncompressed video sizes

Standard definition video	
640×480 full color	= 922 kB/frame
@ 30 frames/s	= 28 MB/s
	= 221 Mb/s
× 3,600 s/h	= 100 GB/h
High definition video	
1,920×1,080 full color	= 6.2 MB/frame
@ 30 frames/s	= 187 MB/s
	= 1.5 Gb/s
× 3,600 s/h	= 672 GB/h

## 2.3 Data Compression

- The more image compression is done, the worse the quality (Q) of that image is.
- Next slide **Figure 2.9a** shows an original, uncompressed image taken by a digital camera that allows full-accuracy images to be captured, with no data compression at all.
- In **Fig. 2.9b,c** that while  $Q = 75$  and  $25$  are not terrible, if we insist on going down to a Quality Factor of  $Q = 5$  we do end up with an unusable image **Fig. 2.9d**.

## 2.3 Data Compression

$$364 \times 485 \times 3 = 529,620 \text{ bytes}$$

Quality factor	Compressed file size	Percentage of original (%)
—	529,620	100
75	37,667	7.11
25	16,560	3.13
5	5,960	1.13

## 2.3 Data Compression

- What is the best compression ratio for JPEG images and for MPEG video, while remaining reasonable quality?
- تحقیق کنید.
- how expensive image and video processing is in terms of processing in the CPU?
- JPEG compression takes some 300 instructions per pixel or, in other words, 100 instructions per image byte → of 2.8 billion instructions per second for standard definition and 19 billion instructions per second for high definition, → a real constraint!
- Simple image darkening: three loads, three shifts, and three stores → total of 12 instructions per pixel, i.e., per 3 bytes and four instructions per image byte → for standard-definition video, we have 28 MB/s, meaning  $28 \times 4 = 112$  mega instructions per second. For high definition, at 187 MB/s, we need 748 mega instructions per second.

```
for x = 1 to columns
{
  for y = 1 to rows
  {
    image[x,y].red   /= 2;
    image[x,y].green /= 2;
    image[x,y].blue  /= 2;
  }
}
```

## 2.4 Multimedia Production

- multimedia production can easily involve a host of people with specialized skills:
  - an art director,
  - graphic designer,
  - production artist,
  - producer,
  - project manager,
  - writer,
  - user interface designer,
  - sound designer,
  - videographer, and
  - 3D and 2D animators,
  - as well as programmers.

## 2.4 Multimedia Production

- During the production timeline:
- The **programmer** is involved when the project is about 40% complete
- the **design** phase consists of:
  - storyboarding,
  - flowcharting,
  - prototyping, and
  - user testing, as well as
  - a parallel production of media.
- Programming and **debugging** phases would be carried out in consultation with marketing, and
- the **distribution** phase would follow.
- **Assignment:** describe what can be done in each part of the design phase.

## 2.5 Multimedia Sharing and Distribution

- Multimedia content, once produced, needs to be published and then shared among users:
  - Optical disks
  - USB
  - Internet
- Consider YouTube, the most popular video sharing site over the Internet, as an example.
- A user can easily create a Google **account** and channel (as YouTube is now owned by Google), and then upload a video, which will be shared to everyone or to selected users.
- YouTube **further** enables titles and tags that are used to classify the videos and link similar videos together (shown as a list of **related** videos).
- The link to this video can be fed into such other **social** networking sites such as Facebook or Twitter as well, potentially propagating to many users of interest in a short time

## 2.5 Multimedia Sharing and Distribution

- The Internet is reshaping traditional TV broadcasting, as well.
- In the **UK**, the BBC's **iPlayer** has been successfully broadcasting high-quality TV programs to both TV subscribers and public Internet users with Adobe Flashplayer since 2007.
- In the **US**, CNBC, Bloomberg Television, and Showtime use **live-streaming** services.
- **China**, the largest *Internet Protocol TV (IPTV)* market by subscribers (12.6 million) to date, is probably the most vigorous market.

## 2.5 Multimedia Sharing and Distribution

- Users' viewing habits are also changing
- IPTV services are becoming highly personalized, integrated, **portable**, and **on-demand**.
- Most service providers are moving beyond basic video offerings toward richer user experiences, particularly with the support for
  - multi-screen viewing across TVs,
  - PCs,
  - **tablets**, and
  - **smartphones**.

## 2.6 Some Useful Editing and Authoring Tools

- Since the first step in creating a multimedia application is probably creation of interesting video clips, we start off with looking at a video editing tool:
- **Premiere:** video editing program that allows you to quickly create a simple digital video by assembling and merging multimedia components

## 2.6 Some Useful Editing and Authoring Tools

- HTML Canvas
- HTML5 canvas is an element used to draw animated graphics on a webpage overtaking Flash and Shockwave.

```
<canvas id="canvas" width="300" height="300" style
="background-color: red">
</canvas>

var canvas = document.getElementById("canvas");
var ctx = canvas.getContext("2d");
// a rectangle with filled color
ctx.fillRect(x, y, width, height);

// a rectangle with border
ctx.strokeRect(x, y, width, height);
```

**Fig. 2.15** A rectangle with pure color (left) and a rectangle with gradient color (right)

## 2.6 Some Useful Editing and Authoring Tools

- **Director:** complete environment for creating interactive “movies” and animation.
- Traditional animation is created by showing slightly different images over time.
- Stage, Cast and Score windows
- The set of predefined events is rich and includes mouse events as well as network events
- Behaviors, prewritten and user-defined, are developed in Lingo → behaviors respond to simple events, such as a click on a sprite

## 2.6 Some Useful Editing and Authoring Tools

- **Adobe XD:** a program to create mockups and prototypes of mobile apps, websites, and software using a series of artboards and links between them.
- It is primarily for user interface or user experience designers to test the visual appearance of their interface designs before it goes to a developer to build in code.
