

Fundamentals of Multimedia

3rd Edition + supplementary material

Chapter 3 :

Graphics and Image Data Representations

- 
- This chapter introduces:
 - how best to represent the graphics and image data since it is of crucial importance in the study of multimedia.
 - The specifics of file formats for storing such images are also discussed

3.1 Graphics/Image Data Types

- Table 3.1 shows a list of file formats used in the popular product Adobe Premiere.
- We concentrate on GIF and JPG image file formats, since the **GIF** file format is one of the simplest and contains several fundamental features,
- and the **JPG** file format is arguably the most important overall.

Table 3.1 Some popular Adobe Premiere file formats

Image	Audio	Video
BMP, DIB,	AIFF, AAC,	AVI, DV,
GIF, HEIF,	AC3, BWF,	FLV, HEVC,
JPG, PICT,	MP3, M4A,	M4V, MOV, MP4,
PNG, PSD,	WAV, WMA	MPG, MTS, MXF,
TGA, TIF		SWF, WMV

3.1.1 1-Bit Images

- Images consist of pixels (picture elements in digital images).
- A **1-bit image (also called binary image)** consists of **on** and **off** bits only and thus is the simplest type of image.
- Each pixel is stored as a single bit (0 or 1)
- It is also sometimes called a **1-bit monochrome (called Lena image by scientists)** image since it contains no color. See Figure in next slide.
- Monochrome
- 1-bit images can be satisfactory for pictures containing only simple **graphics** and **text**.
- fax machines use 1-bit data, so in fact 1-bit images are still important.

Monochrome 1-bit Lena image

A 640×480 monochrome image requires 38.4 kB of storage

3.1.2 8-Bit Gray-Level Images

- **8-bit image** is one for which each pixel has a *gray* value between 0 and 255.
- Each pixel is represented by a single byte.
- The entire image can be thought of as a two-dimensional array of pixel values referred to as a *bitmap*.
- *Image resolution* refers to the number of pixels in a digital image (higher resolution always yields better quality but increases size)

Grayscale image of Lena

640×480 grayscale image requires 300kB of storage

3.1.4 24-Bit Color Images

- In a color 24-bit image, each pixel is represented by three bytes, usually representing RGB.
- Since each value is in the range 0–255, this format supports $256 \times 256 \times 256$, or a total of 16,777,216, possible combined colors; which increases storage size.
- a 640×480 24-bit color image would require 921.6 kB of storage. (without any compression applied)
- Compression is used to decrease the image size by simply grouping pixels effectively. (chapter 7).

24-bit color image forestfire.bmp

Microsoft Windows BMP format

3.1.5 Higher Bit-Depth Images

- In some fields such as medicine (security cameras, satellite imaging) more accurate images are required to see the patient's liver, for example.
- To get such images, special cameras that view more than just 3 colors (RGB) are used.
- Such images are called *multispectral* (more than three colors) or *hyperspectral* (224 colors for satellite imaging).

تأثیر عمق رنگ در کیفیت تصویر

The number of bits used to represent the color of a single pixel.

bits per pixel (bpp).

1bit: Monochrome

24bit: Truecolor

عمق رنگ یا رزولوشن رنگ به تعداد بیت به کار رفته برای نمایش اطلاعات رنگ هر پیکسل گفته می شود.

3.1.6 Quantizing Color Information

- Reasonably accurate color images can be obtained by *quantizing* the color information.
- Color quantizing example: reducing the number of colors required to represent a digital image makes it possible to reduce its file size.
- Example: decreasing the number of bits per pixel from 24 to 8 (decreasing number of colors from 16million to 256)
- Great savings in space for 8-bit images over 24-bit ones:
 - a 640×480 8-bit color image requires only 300 kB of storage,
 - compared to 921.6 kB for a color image (without any other compression applied).

3.1.6 Quantizing Color Information

- First approach: straightforward quantization → decrease the number of bits for each color component:
- From 24 bits per pixel (8 bits for each RGB color components per pixel) to 8 bits per pixel (3 bits for R and G and 2 bits for B component)
- Drawback: “banding” effect

3.1.6 Quantizing Color Information

- Two basic techniques are proposed to reduce the banding effect:
 - Quantization using Look Up Table (LUT)
 - Dithering

Using LUT

Using Dithering

3.1.6 Quantizing Color using LUT

- Use the concept of a *lookup table (LUT)* to store color information:
- Example: we choose 256 most representative colors and store them in an LUT
 - each color can be coded with 8 bits
 - hence it is called 8-bit color image
 - this is called **Vector Quantization**

Notice that the difference between Fig. 3.5a, the 24-bit image, and Fig. 3.7, the 8-bit image, is reasonably small.

Fig. 3.5a, the 24-bit image

Fig. 3.7, the 8-bit image

Another example for difference between Fig. 3.5a, the 24-bit image, and Fig. 3.7, the 8-bit image, is reasonably small.

Fig. 3.5a, the 24-bit image

Fig. 3.7, the 8-bit image

3.1.7 Color Lookup Tables

- The LUT is often called a *palette*.
- The idea is to store only the index, or code value, for each pixel.
- if a pixel stores, say, the value 25 (Figure 3.8), the meaning is to go to row 25 in a color lookup table (LUT).

نحوه تشکیل جدول LUT 3.1.6

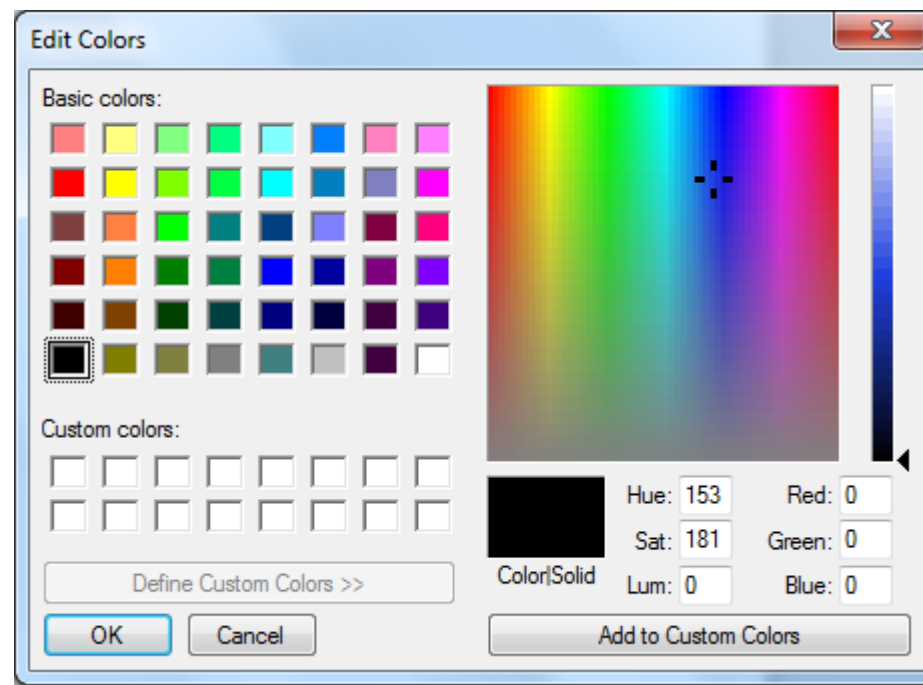

سه روش پایه:

- انتخاب دستی از طریق یک واسطه Color picker
- استفاده از روش خوشه‌بندی Clustering
- استفاده از روش Median Cut

روش دستی انتخاب مجموعه رنگ از طریق پلت رنگ

- A **Color-picker** consists of an array of fairly large blocks of color (or a semi-continuous range of colors) such that a mouse-click will select the color indicated.

- In reality, a color-picker displays the palette colors associated with index values from 0 to 255.

روش خوشه‌بندی انتخاب مجموعه رنگ

تمرکز رنگ یک تصویر در فضای سه بعدی RGB نشان داده شده است. ملاحظه می‌شود قسمت عمده‌ای از فضای رنگ استفاده نشده است. از بین رنگ‌های استفاده شده و در نقاط تمرکز رنگ‌های استفاده شده، مجموعه‌ای از رنگ انتخاب می‌شود.

روش Median-Cut برای انتخاب مجموعه رنگ

نقاط میانه (Median) در هیستوگرام رنگ (Color Histogram) تصویر می‌تواند برای انتخاب مجموعه رنگ لازم برای نمایش نزدیک به واقعیت یک تصویر استفاده شود. بطور پی در پی (successive)، از میانه برای تقسیم فضای رنگ به ۲ و ۴ و ۸ و ... قسمت استفاده می‌شود. پس از k بار، فضای رنگ به 2^k قسمت تقسیم می‌شود و برای هر قسمت یک رنگ بعنوان نماینده آن ناحیه انتخاب می‌شود. در قسمت‌هایی که تمرکز رنگ بیشتری هست، تعداد رنگ بیشتری انتخاب می‌شود.

Red, bit 1

Green bit 2, for Red bit 1==0

Green bit 2, for Red bit 1==1

Dithering

- دیترینگ روشی برای کاهش اثر **banding** در شرایط کاهش رزولوشن رنگ است (برای کاهش حجم فایل تصویر یا بدلیل محدودیت رسانه نمایش تصویر)
- دیترینگ از تکنیک **Halftone** برای افزایش سطوح رنگ (عمق رنگ) از نظر بصری استفاده می‌کند: مثلاً ایجاد ۱۶ سطح خاکستری با استفاده از دو رنگ سیاه و سفید (ایجاد سطوح خاکستری با توزیع نقاط سیاه و سفید با چگالی مختلف)
- دیترینگ جزئیات اطلاعات مکانی تصویر را کاهش می‌دهد تا اثر کاهش رزولوشن رنگ را جبران کند.

تکنیک Halftone مورد استفاده در دیترینگ

◆ A technique that **simulates continuous tone** imagery through the use of dots, varying either in **size**, in **shape** or in **spacing**.

Halftone
dots

How the human eye would see this sort of arrangement from a sufficient **distance**.

Color Halftoning

Three examples of **color halftoning** with CMYK separations. From left to right: The cyan separation, the magenta separation, the yellow separation, the black separation, the combined halftone pattern and finally how the human eye would observe the combined halftone pattern from a sufficient distance.

روش پایه دیترینگ بر پایه تکنیک Halftone

- یک ماتریس دیترینگ $n \times n$ در نظر می گیریم.
- درایه های این ماتریس مقادیر 0 تا $n^2 - 1$ را می گیرند:

$$\begin{pmatrix} 0 & 2 \\ 3 & 1 \end{pmatrix} \qquad \begin{pmatrix} 0 & 8 & 2 & 10 \\ 12 & 4 & 14 & 6 \\ 3 & 11 & 1 & 9 \\ 15 & 7 & 13 & 5 \end{pmatrix}$$

- در هر یک از نقاط این ماتریس می تواند یک نقطه سیاه باشد یا نباشد. پس از نظر تعداد نقاط سیاه موجود $n^2 + 1$ حالت می تواند وجود داشته باشد.
- اگر به فرض از ماتریس 2×2 استفاده کنیم، ۵ حالت قابل تعریف است. پس محدوده مقادیر ممکن رنگ را به ۵ ناحیه تقسیم می کنیم و برای هر کدام یکی حالت های ماتریس دیترینگ چاپ میشود. بطور مثال اگر مقادیر دامنه رنگ هر پیکسل ۴ بیتی (m بیت) باشد، ۱۶ حالت ممکن داریم (مقادیر 0 تا 15). اندازه هر ناحیه برابر $L = 3.2 = 16 \div 5$. اگر مقدار هر پیکسل (y) را به L تقسیم کنیم، مقدار خارج قسمت (z) عددی بین 0 تا 4 خواهد بود (۵ حالت).
- در هر یک از نقاط ماتریس دیترینگ (i, j) اگر $z \leq D(i, j)$ یک نقطه سیاه در آن چاپ می شود.

روش دیترینگ بدون افزایش تعداد پیکسل‌ها

- عیب روش قبل این است که تعداد نقاط پیکسل n^2 برابر خواهد شد.
- می‌توان از این مسئله جلوگیری کرد: روش Ordered Dithering
- در این روش، ماتریس دیترینگ بر روی تصویر لغزانده میشود و اگر $z \leq D(i,j)$ در آن محل یک نقطه سیاه چاپ می‌شود:

Algorithm 3.1

Ordered Dither

begin

for $x = 0$ to x_{max} // columns

for $y = 0$ to y_{max} // rows

$i = x \bmod n$

$j = y \bmod n$

// $I(x, y)$ is the input, $O(x, y)$ is the output, D is the dither matrix.

if $I(x, y) > D(i, j)$

$O(x, y) = 1;$

else

$O(x, y) = 0;$

end

دیترینگ بر روی تصاویر رنگی

Floyd–Steinberg Algorithm

◆ **Distribute the quantization residual to neighboring pixels that have not yet been processed.**

◆ **Pseudocode:**

```
for each y from top to bottom
  for each x from left to right
    oldpixel := pixel[x][y]
    newpixel := find_closest_palette_color(oldpixel)
    pixel[x][y] := newpixel
    quant_error := oldpixel - newpixel
    pixel[x+1][y] := pixel[x+1][y] + 7/16 * quant_error
    pixel[x-1][y+1] := pixel[x-1][y+1] + 3/16 * quant_error
    pixel[x][y+1] := pixel[x][y+1] + 5/16 * quant_error
    pixel[x+1][y+1] := pixel[x+1][y+1] + 1/16 * quant_error
```

List of displays by pixel density
http://en.wikipedia.org/wiki/List_of_displays_by_pixel_density

$$d_p = \sqrt{w_p^2 + h_p^2}$$

$$PPI = \frac{d_p}{d_i}$$

- d_p is diagonal resolution in pixels,
- w_p is width resolution in pixels,
- h_p is height resolution in pixels and
- d_i is diagonal size in inches. (This is the number advertised as the size of the display.)

پردازش تصویر مبتنی بر شیفت هیستوگرام

❖ Plots the number of pixels for each tonal value. By looking at the histogram for a specific image a viewer will be able to judge the entire tonal distribution at a glance.

Count (Number of pixels for each different intensity value)

Intensity (tonal value)

پردازش تصویر مبتنی بر شیفست هیستوگرام

3.2 Popular File Formats

- **8-bit GIF** : one of the most important formats because of its historical connection to the WWW and HTML markup language as the first image type recognized by net browsers.
- **JPEG**: currently the most important common file format.

3.2.1 GIF

- **GIF standard (Graphics Interchange Format):** (We examine GIF standard because it is so simple! yet contains many common elements.)
- Limited to 8-bit (256) color images only, which, while producing acceptable color images, is best suited for images with few distinctive colors (e.g., graphics or drawing).
- GIF standard supports **interlacing** — successive display of pixels in widely-spaced rows by a 4-pass display process. (Figure 3.16, slide 25)
- **interlacing** allows a quick sketch to appear when a web browser displays the image, followed by more detailed fill-ins.
- The JPEG standard (below) has a similar display mode, denoted *progressive mode*.
- GIF has two formats GIF87 (standard) and GIF89 supports simple animation.

3.2.1 GIF

GIF87

- For the standard specification, the general file format of a GIF87 file is as in Fig. 3.12.
- The *Signature* is six bytes
- the *Screen Descriptor* is a seven-byte
- *Local Color Map* (if does not exist

A global color map can be defined)

- A GIF87 file can contain more than one image definition, usually to fit on several different parts of the screen.
- *actual raster data itself is first compressed using the LZW compression scheme (see Chap. 7)*

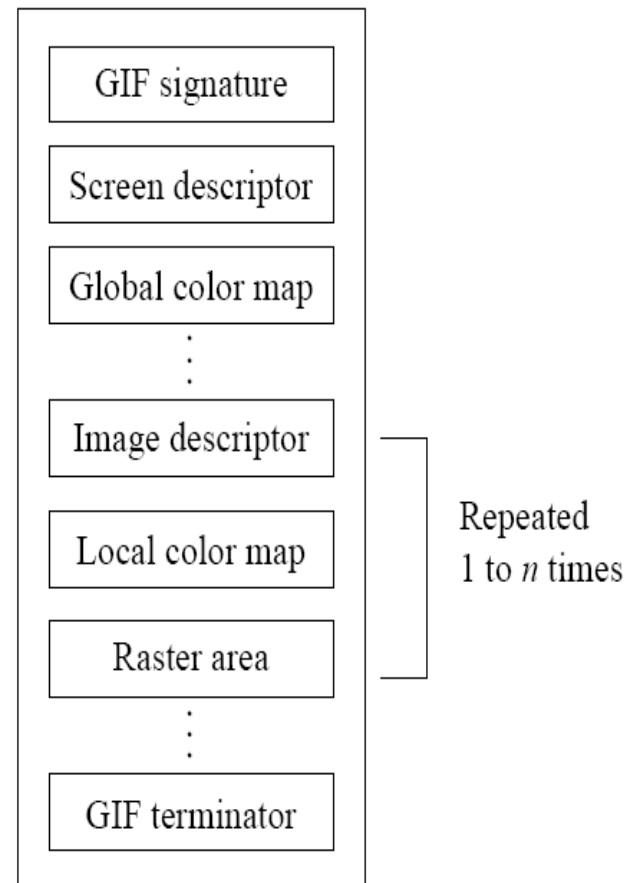

Fig. 3.12: GIF file format.

- **Screen Descriptor** comprises a set of attributes that belong to every image in the file. According to the GIF87 standard, it is defined as in Fig. 3.13.

- LSB/ MSB :

Least/Most Significant Byte

- Bit 7 is filled with zeros

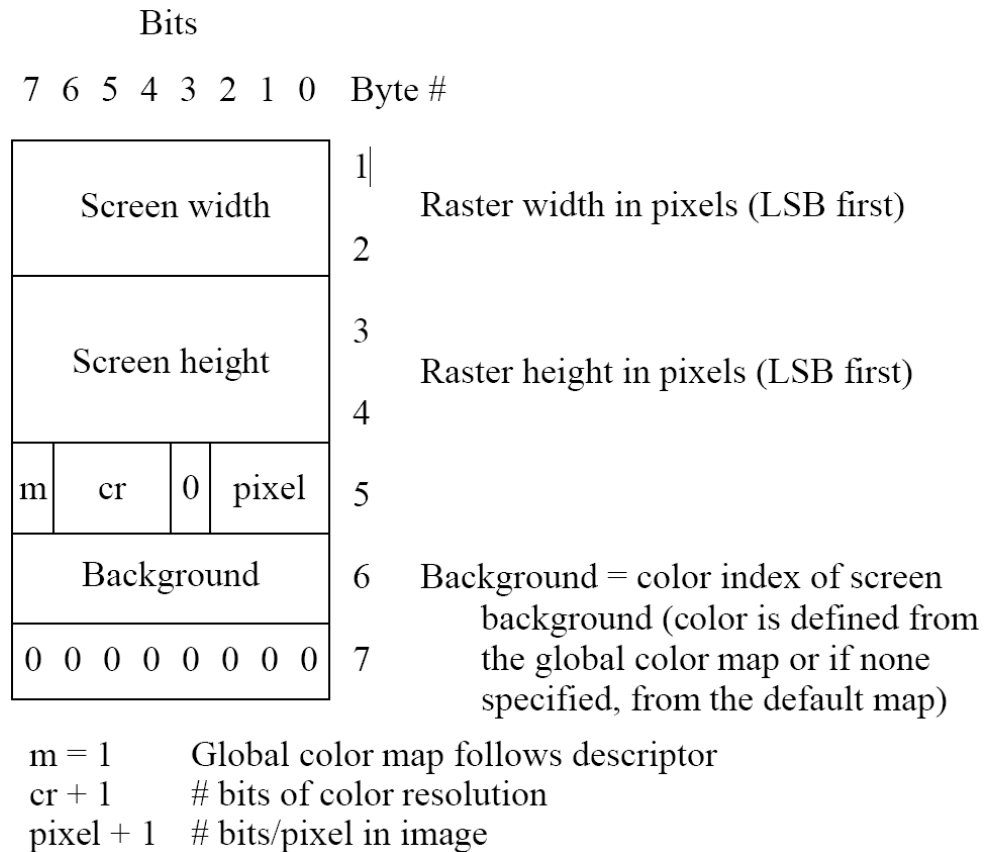

Fig. 3.13: GIF screen descriptor.

- **Color Map** is set up in a very simple fashion as in Fig. 3.14. However, the actual length of the table equals $2^{(pixel+1)}$ as given in the Screen Descriptor.

Bits				
7	6	5 4 3 2 1 0	Byte #	
Red intensity			1	Red value for color index 0
Green intensity			2	Green value for color index 0
Blue intensity			3	Blue value for color index 0
Red intensity			4	Red value for color index 1
Green intensity			5	Green value for color index 1
Blue intensity			6	Blue value for color index 1
⋮				(continues for remaining colors)

Fig. 3.14: GIF color map.

- Each image in the file has its own **Image Descriptor**, defined as in Fig. 3.15.

Bits						Byte #	
7	6	5	4	3	2		
0	0	1	0	1	1	0	0
Image left						1	Image separator character (comma)
						2	Start of image in pixels from the left side of the screen (LSB first)
Image top						3	
						4	Start of image in pixels from the top of the screen (LSB first)
Image width						5	
						6	Width of the image in pixels (LSB first)
Image height						7	
						8	Height of the image in pixels (LSB first)
m i 0 0 0 pixel						9	
						10	m = 0 Use global color map, ignore 'pixel'
							m = 1 Local color map follows, use 'pixel'
							i = 0 Image formatted in Sequential order
							i = 1 Image formatted in Interlaced order
							pixel + 1 # bits per pixel for this image

Fig. 3.15: GIF image descriptor.

interlace

- If the *interlace* bit is set to (1), then the local Image Descriptor, the rows of the image are displayed in a four-pass sequence, as in Fig. 3.16. (next slide)
- Here, the first pass displays rows 0 and 8, the second pass displays rows 4 and 12, and so on.

Image row	Pass 1	Pass 2	Pass 3	Pass 4	Result
0	*1a*				*1a*
1				*4a*	*4a*
2			*3a*		*3a*
3				*4b*	*4b*
4		*2a*			*2a*
5				*4c*	*4c*
6			*3b*		*3b*
7				*4d*	*4d*
8	*1b*				*1b*
9				*4e*	*4e*
10			*3c*		*3c*
11				*4f*	*4f*
12		*2b*			*2b*
⋮					

Fig. 3.16: GIF 4-pass interlace display row order.

3.2.2 JPEG

- **JPEG (Joint Photographic Experts Group):** The most important current standard for image compression (.jpg, .jpeg, .jpe).
- The human vision system has some specific limitations (The eye-brain system cannot see **extremely fine detail**; those are dropped) and JPEG takes advantage of these to achieve high rates of compression.
- JPEG allows the user to set a desired level of quality, or compression ratio (input divided by output).
- As an example, Fig. 3.17 shows our **forestfire** image, with a quality factor $Q=10\%$.
 - - This image is a mere 1.5% of the original size. In comparison, a JPEG image with $Q=75\%$ yields an image size 5.6% of the original, whereas a GIF version of this image compresses down to 23.0% of uncompressed image size.

A photo of a flower compressed with successively more lossy compression ratios from left to right.

Fig. 3.17: JPEG image with low quality specified by user.

PNG

- **PNG format:** standing for **Portable Network Graphics** — meant to supersede the GIF standard, and extends it in important ways.
- Special features of PNG files include:
 1. Support for up to 48 bits of color information — a large increase.
 2. Files may contain gamma-correction information for correct display of color images, as well as alpha-channel information for such uses as control of transparency.
 3. The display progressively displays pixels in a 2-dimensional fashion by showing a few pixels at a time over seven passes through each 8 X 8 block of an image.

TIFF

- **TIFF**: stands for **Tagged Image File Format**.

- The support for attachment of additional information (referred to as “tags”) provides a great deal of flexibility.

1. The most important tag is a format signifier: what type of compression etc. is in use in the stored image.

2. TIFF can store many different types of image: 1-bit, grayscale, 8-bit color, 24-bit RGB, etc.

3. TIFF was originally a lossless format but now a new JPEG tag allows one to opt for JPEG compression.

4. The TIFF format was developed by the Aldus Corporation in the 1980's and was later supported by Microsoft.

3.2.9 PS and PDF

- PostScript is an important language for typesetting, and many high-end printers have a PostScript interpreter built into them.
- PostScript is a vector-based, rather than pixel based, picture language: page elements are essentially defined in terms of vectors.
- PostScript includes vector/structured graphics as well as text
- Several popular graphics programs, such as Adobe Illustrator, use PostScript.
- Note, however, that the PostScript page description language does not provide compression; in fact, PostScript files are just stored as ASCII.

3.2.9 PS and PDF

- Therefore, another text + figures language has largely superseded PostScript is *Portable Document Format (PDF) file format*.
- PDF files that do not include images have about the same compression ratio, while
- For files containing images, PDF may achieve higher compression ratios by using separate JPEG compression for the image content

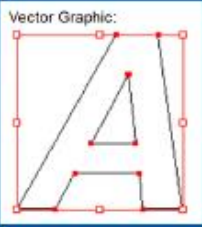

Raster vs. Vector Graphics

3.2.5 Windows BMP

- *BitMap* (BMP), also known as *Device Independent Bitmap* (DIB), is a major system standard image file format for Microsoft Windows.
- It uses raster graphics. BMP supports many pixel formats, including indexed color (up to 8 bits per pixel), and 16, 24, and 32-bit color images.
- It makes use of Run-Length Encoding (RLE) compression (see Chap. 7) and can fairly efficiently compress 24-bit color images due to its 24-bit RLE algorithm.
- BMP images can also be stored uncompressed. In particular, the 16-bit and 32-bit color images (with α -channel information) are always uncompressed.
- Note: The alpha channel is a **special channel that handles transparency**. When an image has an alpha channel on it, it means you can adjust the image's opacity levels and make bits translucent or totally see-through. The alpha channel is instrumental when you want to remove the background from an image.

3.2.6 WindowsWMF

- *Windows MetaFile* (WMF) is the native vector file format for the Microsoft Windows operating environment. WMFfiles actually consist of a collection of *Graphics Device Interface* (GDI) function calls, also native to the Windows environment.
- When a WMF file is “played” (typically using the Windows `PlayMetaFile()` function) the described graphic is rendered. WMF files are ostensibly device-independent and unlimited in size.
- The later Enhanced Metafile Format Plus Extensions (EMF+) format is device independent.

3.2.7 Netpbm Format

- *PPM* (Portable PixMap), *PGM* (Portable GrayMap), and *PBM* (Portable BitMap) belong to a family of open-source Netpbm formats. These formats are mostly common in the Linux/Unix environments. They are sometimes also collectively known as PNM or PAM (Portable AnyMap).
- These are either ASCII files or raw binary files with an ASCII header for images.
- Because they are so simple, they can always be used for cross-platform applications. They are widely supported by various software, e.g., GIMP in Linux and mac OS, and work in Windows as well.

3.2.8 EXIF

- *Exchangeable Image File* (EXIF) is an image format for digital cameras. It enables the recording of image metadata (exposure, light source/flash, white balance, type of scene, etc.) for the standardization of image exchange.
- A variety of tags (many more than in TIFF) is available to facilitate higher-quality printing, since information about the camera and picture-taking conditions can be stored and used, e.g., by printers for possible color-correction algorithms.
- The EXIF format is incorporated in the JPEG software in most digital cameras. It also includes specification of file format for audio that accompanies digital images.

3.2.9 HEIF

- *High Efficiency Image File* (HEIF) is the still-image version of the HEVC (or H. 265) video format.
- It has been adopted by Apple to replace JPEG in all of its iDevices.
- HEIF is said to be a container to wrap still images compressed with the HEVC codec. The container is very flexible: it can be used to store image sequences, depth information, thumbnail images, audio, etc. HEIF is more efficient than JPEG, i.e., the image size can be reduced by half with almost imperceptible changes to image quality.
- HEIF supports up to 14-bit color depth, which is higher than the color depth in JPEG (usually 8-bit, can be up to 12-bit).
- As in GIF, HEIF also supports transparency.

نگاهی به آناتومی چشم انسان

- در کالبدشناسی چشم انسان، گوده مرکزی (انگلیسی: Fovea centralis) به فرورفتگی ریزی در مرکز لکه زرد گفته می شود که حاوی یاخته های مخروطی است که به علت افزایش طولشان به یاخته های استوانه ای شبیه شده اند. [۱۷]
- در مرکز شبکیه، ناحیه کوچکی به نام لکه زرد وجود دارد که در آن فقط نورون های مخروطی یافت می شود. در نواحی دورتر از لکه زرد به تدریج از تعداد نورون های مخروطی کاسته شده و بر تعداد نورون های استوانه ای افزوده می شود.

End of Chapter 3
